

## **The Sensor Web – Bringing the World into the Classroom**

The convergence of ubiquitous broadband and low cost sensing provide an unprecedented opportunity for innovation in both the future of University research and the educational experience. In this presentation I will provide an overview of how these technologies are evolving and consider the implications for Universities. As exemplars I will draw on two national projects, RedMaP and SenseT, that are hosted at the University of Tasmania to demonstrate the power of citizen science and pervasive sensing technologies. The presentation will conclude with a personal perspective on the the challenges these innovations pose for Universities and their technology strategies.
